

Scoreboard / shot-clock or clock installation

Details

Physical installation

Our scoreboards, basketball shot-clocks and clocks are supplied with detailed installation instructions for self-installation, but we are pleased to offer an installation service from our in-house technicians.

We send two technicians to your facility, protect your sports floor and build a lightweight aluminium tower and fix your scoreboard to the wall.

We normally fix scoreboards between 4.5m and 5m above the floor, and normally on the side of the hall opposite the entrance so that people at the door can see how much time is elapsed. We require a suitably solid wall to which to fix the scoreboard. If we determine the wall is not suitable to fix to when we are on site then an abortive visit charge will apply.

Electrical installation

A 13amp power supply (3-pin socket or fused spur) is required to be located by others next to the power input to the scoreboard - we will confirm the location on receipt of your order which is dependent on the model of the board.

We recommend an isolator / breaker is installed at low level (e.g. in the store room) to enable the unit to be powered down without requiring high level access, but this is not essential.

If the unit is to be powered from a fused spur, the connection to the supply must be undertaken by a suitably qualified electrician - **we do not provide an electrician**. If a 3-pin socket is provided our fitters can plug the unit in to the socket, but please note that **we do not install conduit or install lengths of wiring** so the fused spur or socket must be adjacent to the power input of the scoreboard. If the power supply is not adjacent to the scoreboard, then conduit and cabling must be installed by others.

Site visit charge

The price shown is the charge for our time on site. In addition an "Area Charge" will be applied at the checkout based on your distance from our factory. You do not have to commit to the purchase until you have seen that

charge.
