

Balance beam with hooks both ends

09398A0XXX

Details

Balance beam with hooks at both ends. An extruded aluminium and plywood construction with seal grey upholstery to the top and sides.

The balance beam is designed to span between climbing frames to allow children to experience and practice balance and travelling at height. The beams can also be used to span between items such as trestles.

The beams have sprung loaded safety locking devices at both ends to prevent the beam accidentally coming away from the tube it is locked onto.

Available in two lengths:

- 2.1m, (7') long - to suit a steel 3-gate Foldaway climbing frame with a wall fixed ladder, or to span between a climbing frame and trestles or between two nesting tables or trestles.
- 3.0m, (10') long - to suit a pair of timber wall hinged climbing frames, or to

span between a climbing frame and trestles or between two nesting tables or trestles.
