Trampoline park rest areas

Details

We normally incorporate a number of rest areas within a main jumping area of a trampoline park.

Rest areas have a steel sub-structure, encased in timber, with padded panels and padding to the exposed surfaces. They are designed for the following uses:

- Taking a safe rest from bouncing without taking up a trampoline
- Landing the last move from a routine
- An additional challenge given the extra height needed to land on the rest area
- Chill-out areas for bouncers to plan their next moves

We manufacture rest areas in a number of styles and sizes:

- 500mm high square area with vertical padded sides
- 500mm high rectangle with angled trampolines to the sides
- 1200mm high rectangle with angled trampolines to the sides

Rest areas can be padded in any of our PVC colours
