Personal tricking columns

Details

Personal tricking columns are designed for one person to accurately end a routine or for one person to start a bouncing routine from a higher starting point.

The columns have a steel sub-structure encased in timber and are uphostered in foam and PVC.

Personal tricking columns are 500mm high as standard and fit in the join between 4 trampolines so do not reduce the available jumping area.

As a manufacturer we can also manufacture similar units to suit your individual requirements - see the image of and inverted "T" shaped multi-height personal tricking column developed specifically for a customer, as well as the straight and angled tricking / parkour walls which are used for the same purpose.
