

Recess edge padding

Details

Sport England guidance requires sports hall walls to be flush.

Sometimes windows, viewing areas, fire doors and similar create recesses which result in a hard 90° corner to the edge of the recess. Such corners that risk injury should be padded to reduce the risk of injury.

We manufacture bespoke pads to suit any size and depth of recess. The pads utilise a firm resilient foam on a timber backing board upholstered in your choice of 28 PVC colours: [PVC Colour Chart](#)

The pads are fixed to the recess edge using VELCRO® Fasteners onto a timber bearer that is fixed to the recess edge.

Door recess edge padding is available in 2m or 2.4m height as standard but any bespoke height can be accommodated.

Window or other recess edge padding is made bespoke to suit each situation.
